

15. Mr Wilkin – Innovative Technology - Technical General Manager

At first, I chose this industry because

I studied information technology related subjects at school

So I naturally worked in this field after graduation

I am mainly responsible for managing some information technology projects

Working hour is fixed as normal office hours

Of course you are required to have some knowledge about information technology

And knowledge about software and hardware

Then you must have some experience in project management

There are different courses for this field

If you did not have the chance to learn such knowledge at college

You can apply for courses after graduation to gain knowledge of this industry

The most satisfying thing is completing a project and being able to sell it to clients

Then the public will get to know the product

The job satisfaction is great

These are the reasons why I keep working in this field

Since different projects have different challenges and they are very interesting

There is pressure in this industry and they come from clients

For example, whether the client's request can be implemented

Or whether it can be completed within the time requirement

Another challenge is the arrangement of resources during the development process

It takes a long time for developing a project

There may be many problems related to resources in the process

Or technical problems

We worry that we might not have enough time to solve all these problems

And whether we could deliver the product within the agreed time

These are all stressful for us

It will take a long time to work on information technology projects

Sometimes we are required to work overtime

As long as you know how to manage your time, it is no difference from other types of work

It won't affect your family life or social life

Yes, first you need to be interested in information technology

As long as you are interested in it, you will like to work in this industry

If you are not interested in technology, it would be more difficult to engage in this industry

Then you need to learn some basic knowledge, for example, programming

It is necessary to learn this basic knowledge

Coding / Programming is something that the next generation must learn

There are more ways to learn programme codes nowadays and they are simple

You need to equip yourself and learn some basic applications before entering the industry
